### DBMS/SQL

Lesson 03: Data Query Language (The Select Statement)

### Lesson Objectives

- To understand the following topics:
  - The SELECT statement
    - The WHERE clause
    - The DISTINCT clause
    - The Comparison, Arithmetic, and Logical operators
    - The ORDER BY clause

### The Select Statement and Syntax

- The SELECT command is used to retrieve rows from a single table or multiple Tables or Views.
  - A query may retrieve information from specified columns or from all of the columns in the Table.
  - It helps to select the required data from the table.

```
SELECT [ALL | DISTINCT] { * | col_name,...}

FROM table_name alias,...

[ WHERE expr1 ]

[ CONNECT BY expr2 [ START WITH expr3 ] ]

[ GROUP BY expr4 ] [ HAVING expr5 ]

[ UNION | INTERSECT | MINUS SELECT ... ]

[ ORDER BY expr | ASC | DESC ];
```

### Selecting Columns

Displays all the columns from the student\_master table

```
SELECT * FROM student_master;
```

Displays selected columns from the student\_master table

```
SELECT student_code,
student_name
FROM student_master;
```

### The WHERE clause

- The WHERE clause is used to specify the criteria for selection.
  - For example: displays the selected columns from the student\_master table based on the condition being satisfied

SELECT student\_code, student\_name, student\_dob FROM student\_master WHERE dept\_code = 10;

# Character Strings and Dates

- Are enclosed in single quotation marks
- Character values are case sensitive
- Date values are format sensitive

SELECT student\_code, student\_dob FROM student\_master WHERE student\_name = 'Sunil';

# Mathematical, Comparison & Logical Operators

- Mathematical Operators:
  - Examples: +, -, \*, /
- Comparison Operators:

| Operator      | Meaning                  |
|---------------|--------------------------|
| =             | Equal to                 |
| >             | Greater than             |
| >=            | Greater than or Equal to |
| <             | Less than                |
| <=            | Less than or Equal to    |
| <>, !=, or ^= | Not Equal to             |

- Logical Operators:
  - Examples: AND, OR, NOT

# Other Comparison Operators

| Other Comparison operators | Description  |
|----------------------------|--|
| [NOT] BETWEEN x AND y      | Allows user to express a range.  |
|                            | For example: Searching for numbers BETWEEN 5 and 10. The optional NOT would be used when searching for numbers that are NOT BETWEEN 5 AND 10.  |
| [NOT] IN(x,y,)             | Is similar to the OR logical operator. Can search for records which meet at least one condition contained within the parentheses.  |
|                            | For example: Pubid IN (1, 4, 5), only books with a publisher id of 1, 4, or 5 will be returned. The optional NOT keyword instructs Oracle to return books not published by Publisher 1, 4, or 5. |

# Other Comparison Operators

| Other Comparison operators | Description   |
|----------------------------|---|
| [NOT] LIKE                 | Can be used when searching for patterns if you are not certain how something is spelt.  |
|                            | For example: title LIKE 'TH%'. Using the optional NOT indicates that records that do contain the specified pattern should not be included in the results. |
| IS[NOT]NULL                | Allows user to search for records which do not have an entry in the specified field.  |
|                            | For example: Shipdate IS NULL.  |
|                            | If you include the optional NOT, it would find the records that do not have an entry in the field.  |
|                            | For example: Shipdate IS NOT NULL.  |

# BETWEEN ... AND Operator

■ The BETWEEN ... AND operator finds values in a specified range:

SELECT staff\_code,staff\_name FROM staff\_master WHERE staff\_dob

BETWEEN '01-Jan-1980'

AND '31-Jan-1980';

# **IN** Operator

- The IN operator matches a value in a specified list.
  - The List must be in parentheses.
  - The Values must be separated by commas.

SELECT dept\_code FROM department\_master WHERE dept\_name IN ( 'Computer Science', 'Mechanics');

# **IN** Operator

- The IN operator matches a value in a specified list.
  - The List must be in parentheses.
  - The Values must be separated by commas.

SELECT dept\_code FROM department\_master WHERE dept\_name IN ( 'Computer Science', 'Mechanics');

#### 3.2: SELECT statement Clauses

## LIKE Operator

- The LIKE operator performs pattern searches.
  - The LIKE operator is used with wildcard characters.
  - Underscore (\_) for exactly one character in the indicated position
  - Percent sign (%) to represent any number of characters

SELECT book\_code,book\_name FROM book\_master
WHERE book pub author LIKE '%Kanetkar%';

#### 3.2: SELECT statement Clauses

# **Logical Operators**

- Logical operators are used to combine conditions.
  - Logical operators are NOT, AND, OR.
    - NOT reverses meaning.
    - AND both conditions must be true.
    - OR at least one condition must be true.
  - Use of AND operator

```
SELECT staff_code,staff_name,staff_sal FROM staff_master WHERE dept_code = 10
AND staff_dob > '01-Jan-1945';
```

### Using AND or OR Clause

Use of OR operator:

SELECT book\_code FROM book\_master WHERE book\_pub\_author LIKE '%Kanetkar%' OR book\_name LIKE '%Pointers%';

# **Using NOT Clause**

- The NOT operator finds rows that do not satisfy a condition.
  - For example: List staff members working in depts other than 10 & 20.

SELECT staff\_code,staff\_name FROM staff\_master WHERE dept\_code NOT IN (10,20);

### Treatment of NULL Values

- NULL is the absence of data.
- Treatment of this scenario requires use of IS NULL operator.

| SQL> | SELECT student_code      |
|------|--------------------------|
| 2    | FROM student_master      |
| 3    | WHERE dept_code IS NULL; |

### Operator Precedence

Operator precedence is decided in the following order:

| Levels | Operators   |
|--------|---|
| 1      | * (Multiply), / (Division), % (Modulo)  |
| 2      | + (Positive), - (Negative), + (Add), (+ Concatenate), - (Subtract), & (Bitwise AND) |
| 3      | =, >, <, >=, <=, <>, !=, !>, !< (Comparison operators)                              |
| 4      | NOT   |
| 5      | OR  |
| 6      | AND   |
| 7      | ALL, ANY, BETWEEN, IN, LIKE, OR, SOME   |
| 8      | = (Assignment)  |

### The DISTINCT clause

- The SQL DISTINCT clause is used to eliminate duplicate rows.
  - For example: Displays student codes from student\_marks tables. the student codes are displayed without duplication

SELECT DISTINCT student\_code FROM student\_marks;

### The ORDER BY clause

- The ORDER BY clause presents data in a sorted order.
  - It uses an "ascending order" by default.
  - You can use the DESC keyword to change the default sort order.
  - It can process a maximum of 255 columns.
- In an ascending order, the values will be listed in the following sequence:
  - Numeric values
  - Character values
  - NULL values
- In a descending order, the sequence is reversed.

## **Sorting Data**

- The output of the SELECT statement can be sorted using ORDER BY clause
  - ASC : Ascending order, default
  - DESC: Descending order
- Display student details from student\_master table sorted on student\_code in descending order.

```
SELECT Student_Code, Student_Name, Dept_Code,
Student_dob
FROM Student_Master
ORDER BY Student_Code DESC;
```

- It is necessary to always include a WHERE clause in your SELECT statement to narrow the number of rows returned.
  - If you do not use a WHERE clause, then Oracle will perform a table scan of your table, and return all the rows.
  - By returning data you do not need, you cause the SQL engine to perform I/O it does not need to perform, thus wasting SQL engine resources.

- In addition, the above scenario increases network traffic, which can also lead to reduced performance.
- And if the table is very large, a table scan will lock the table during the timeconsuming scan, preventing other users from accessing it, and will hurt concurrency.
- In your queries, do not return column data that is not required.
  - For example:
    - You should not use SELECT \* to return all the columns from a table if all the data from each column is not required.
    - In addition, using SELECT \* prevents the use of covered indexes, further potentially decreasing the query performance.

- Carefully evaluate whether the SELECT query requires the DISTINCT clause or not.
  - The DISTINCT clause should only be used in SELECT statements.
    - This is mandatory if you know that "duplicate" returned rows are a possibility, and that having duplicate rows in the result set would cause problems with your application.
  - The DISTINCT clause creates a lot of extra work for SQL Server.
    - The extra load reduces the "physical resources" that other SQL statements have at their disposal.
  - Hence, use the DISTINCT clause only if it is necessary.

- In a WHERE clause, the various "operators" that are used, directly affect the query performance.
  - Given below are the key operators used in the WHERE clause, ordered by their performance. The operators at the top produce faster results, than those listed at the bottom.
    - =
    - >, >=, <, <=
    - LIKE
    - <>
  - Use "=" as much as possible, and "<>" as least as possible.

- If you use LIKE in your WHERE clause, try to use one or more leading character in the clause, if at all possible.
  - For example: Use LIKE 'm%' not LIKE '%m'
- Certain operators in the WHERE clause prevents the query optimizer from using an Index to perform a search.
  - For example: "IS NULL", "<>", "!=", "!>", "!<", "NOT", "NOT EXISTS", "NOT IN", "NOT LIKE", and "LIKE '%500"

- Suppose you have a choice of using the IN or the BETWEEN clauses. In such a case use the BETWEEN clause, as it is much more efficient.
  - For example: The first code is much less efficient than the second code given below.

SELECT customer\_number, customer\_name FROM customer WHERE customer\_number in (1000, 1001, 1002, 1003, 1004)

SELECT customer\_number, customer\_name FROM customer WHERE customer\_number BETWEEN 1000 and 1004

- Do not use ORDER BY in your SELECT statements unless you really need to use it.
  - Whenever SQL engine has to perform a sorting operation, additional resources have to be used to perform this task.

### Summary

- In this lesson, you have learnt:
  - What is SELECT statement?
  - Usage of the following:
    - The WHERE clause
    - The DISTINCT clause
    - The Comparison, Arithmetic, and Logical operators
    - The AND or OR clause
    - The NOT clause
    - The ORDER BY clause

### Review – Questions

- Question 1: The \_\_\_\_ table consists of exactly one column, whose name is "dummy".
- Question 2: The LIKE operator comes under the \_\_\_\_ category.

- Option 2: comparison
- Option 3: logical

### Review – Questions

- Question 4: The NOT NULL operator finds rows that do not satisfy a condition.
  - True / False
- Question 5: More than one column can also be used in the ORDER BY clause.
  - True / False
